Agellis receives an order for more than 0.5 MSEK for delivery to a American steel plant

AGELLIS Group, which sells level measurement and slag indication systems to global metals producers, has received an order worth more than 0.5 million SEK for an instrument to be supplied to an American steelworks.

The deal applies to a system to measure steel level in continuous casting tundishes (EMLI-T). The instrument is to be delivered and installed during the second quarter of this year.

The system has been evaluated by the steelworks during a loan period and has showed great process advantages for the plant which is part of a larger steelworks group.

"It's positive that after a long evaluation of the EMLI-T system we received the order. We hope that this evaluation and order will get other steelworks in the same group interested in our products." says CEO Patrick Bloemer.

For competitive reasons, Agellis chooses not to mention the client by name.

All Agellis products are based on a common electronic platform called EMLI. EMLI T (Tundish) measures the steel level in a tundish with high accuracy, independent of slag and powder thickness. A reliable measurement of the steel level in the tundish helps the plant to increase production and obtain a higher yield.
